Sprint 2
AI Usage Log

Responsible Person: Elyes Jallouli

Sprint: Sprint 2

Project: CareerConnect

Scope: Job postings, job management, job applications, frontend integration

Task 1 - Create and View Job Postings

Purpose of AI Use: Understand and implement the recruiter workflow for creating and viewing job postings, including React components and REST API integration.

Prompt: "Could you help me understand how to approach these features step by step? Explain the relevant concepts suggest appropriate implementation approaches and show practical examples so I can understand how to apply them to our existing codebase. Tell me how to identify common integration issues, understand error messages, and learn how to test and validate the functionality before submitting my pull requests."

AI-Suggested Content: Suggested frontend component structure, form handling, API requests, routing and integration approaches and explained to me how to handle corresponding programs.

Validation: Ran the application locally, inspected the pages and tested creating and displaying postings. Checked integration with existing team code.

Decision: Accepted.

Reflection: The assistance accelerated implementation and clarified frontend/backend integration, real behavior still required hands-on testing.

Task 2 - Edit and Delete Job Postings

Purpose of AI Use: Extend the recruiter workflow to update and remove existing postings and handle interface issues.

Prompt: Asked for guidance on editing and deleting postings, UI behavior and debugging.

AI-Suggested Content: Suggested component and API wiring, update/delete workflows, and CSS fixes for long job descriptions.

Validation: Checked the pages in the running application; corrected description overflow in Jobs.css. Authorization must be enforced server-side, not assumed from the interface.

Decision: Accepted with modifications.

Reflection: Testing realistic content exposed display issues not evident from code alone.

Task 3 - Apply to a Job

Purpose of AI Use: Connect a selected job to an application page and support the user application flow.

Prompt Requested an explanation on how to job application routing.

AI-Suggested Content: Suggested React/TypeScript application-page logic.

Decision: Accepted.

Reflection: The key challenge was fully understanding and to make the application feature fit the existing project rather than implementing it in isolation.
