Sprint 2 Individual Contribution Log

Course: SOEN 341 – Software Process
Project: CareerConnect – Job Search and Application Tracking Platform
Sprint: Sprint 2
Team Member: Bilal Qadir
Total Time Spent: Approximately 20 hours

1. Edit and Manage Job Postings

Time Spent: Approximately 5 hours

Issue:
https://github.com/Sprytte/CareerConnect/issues/35

Pull Request:
https://github.com/Sprytte/CareerConnect/pull/67

Contribution:
I worked on the backend functionality for editing and deleting job postings. I added the required endpoints and connected them to the existing job posting service. I also made sure that editing a posting would not change the user who originally created it.

I tested the functionality and made additional changes after receiving pull request feedback before the feature was merged.

2. Search for Jobs and Job Filtering

Time Spent: Approximately 8 hours

Search for Jobs Issue:
https://github.com/Sprytte/CareerConnect/issues/39

Job Filtering Issue:
https://github.com/Sprytte/CareerConnect/issues/38

Pull Request:
https://github.com/Sprytte/CareerConnect/pull/66

Contribution:
I implemented the Search for Jobs frontend and connected it to the actual job posting API instead of using mock data.

The page allows users to view available jobs and search through them. I also implemented filtering by keyword, location, and category. This filtering functionality also completed the requirements of issue #38, which was included as part of the Search for Jobs implementation.

I tested the page using job postings from the backend and made changes based on pull request feedback. I also resolved Git conflicts and rebuilt the branch on top of the latest main branch before the final merge.

3. View Created Job Postings

Time Spent: Approximately 7 hours

Issue:
https://github.com/Sprytte/CareerConnect/issues/48

Pull Request:
https://github.com/Sprytte/CareerConnect/pull/68

Contribution:
I worked on the backend functionality that allows recruiters to view the job postings they created.

I added authenticated endpoints for retrieving all job postings created by the signed-in recruiter and retrieving an individual posting. I also added functionality for recruiters to view the applications submitted to one of their job postings.

The implementation uses the authenticated user's session to identify the recruiter and includes ownership checks so that a recruiter cannot access applications belonging to another user's posting.

I tested the endpoints using an authenticated account and Postman. I tested both cases where a job posting had no applications and where an actual application had been submitted.

Summary

During Sprint 2, I contributed to both the frontend and backend of CareerConnect. My frontend work focused mainly on the Search for Jobs and filtering functionality. My backend work included editing and deleting job postings and allowing recruiters to view their created postings and the applications submitted to them.

I spent approximately **20 hours** on implementation, testing, debugging, addressing review feedback, resolving Git conflicts, and preparing the features for merge.
