

Sprint 1 AI-use log

CareerConnect | SOEN 341 | Arley Ndaribike | 26 September 2026

Responsible person for entries 1–5: Arley Ndaribike. Tools used: ChatGPT and Kimi K3.

Purpose. This report records where AI affected my Sprint 1 work, how I checked suggestions, what I changed, and what remains unresolved.

1. Build and revise the welcome page

Task / purpose

Implement a CareerConnect landing page and incorporate teammate feedback in PR #17.

Selected, paraphrased prompt segment

Review a React landing page for a job-search platform: a hero section, feature highlights, a header with navigation and a sign-in control, and a footer. Suggest concrete edits to extract reusable header and footer components, organize the CSS, improve header contrast for readability, and keep the sign-in control honest while the authentication flow is still undecided.

AI suggestion

A responsive hero and feature sections; extracted SiteHeader and SiteFooter components; grouped CSS, browser branding, local setup notes and PR review steps.

Critical review

An early page screenshot did not show a working account flow, so Sign in remained disabled in PR #17. Feedback called for a slightly darker header and clearer component and CSS organization. I revised the design and structure instead of treating the first output as finished.

Validation

Ran npm run lint and npm run build from frontend/; inspected local screenshots and shared a page screenshot for feedback; checked git diff --check. Review discussion and merged commits are visible in PR #17. Authentication was not tested as part of that page.

Decision

Modified before use. The reviewed welcome page merged through PR #17. A clickable sign-in entry point was added later on a separate auth branch; end-to-end login is unverified.

Reflection

AI translated feedback into concrete edits. Peer review and a running page exposed gaps code generation alone could not settle.

Repository evidence: PR #17: <https://github.com/Sprytte/CareerConnect/pull/17>; commits e04e232 (components/styling) and bdbd1bd (portable README); merged main ec97765.

2. Prepare the React sign-in integration

Task / purpose

Connect the welcome-page control to the documented backend OAuth2 entry point without claiming a verified login.

Selected, paraphrased prompt segment

A React (Vite/TypeScript) frontend must connect to a backend that exposes OAuth2 login at /oauth2/authorization/okta and a documented logout route. Propose a sign-in link, a credentialed current-user check, and a session-aware header that renders signed-in and signed-out states. Keep all secrets on the backend, introduce no new auth package, and explicitly flag any backend endpoint the frontend would need that does not exist yet.

AI suggestion

Use a browser link to /oauth2/authorization/okta, a credentialed request to proposed /api/v1/cc/security/me, conditional header state, and a POST form to the documented logout route. No new Auth0 React package or frontend secret was introduced.

Critical review

The backend docs described a redirect, but the team discussion indicated login did not yet return to React. The inspected backend lacked /me; its /user-info/{userId} route was not a trusted current-user check in that branch. A readable cookie was not accepted as login proof. The response shape in React is a proposal, not an agreed API contract.

Validation

Applied the patch on feature/auth-frontend, reviewed the staged four-file diff and checked for accidental text. ESLint and TypeScript/Vite build passed (20 modules transformed). A local screenshot showed the welcome page and expected Account status unavailable. Signed-in name, redirect and logout are not verified.

Decision

Modified before use. Committed as 2fc6ba7 and merged through PR #26. The backend added the current-user endpoint and a login redirect fix through PR #25, completing the sign-in path in main. Role-based behavior remains follow-up work.

Reflection

The key was separating compiled code from working product behavior. A successful build does not show that a session exists, roles are enforced or logout works.

Repository evidence: PR #26: <https://github.com/Sprytte/CareerConnect/pull/26>; frontend/src/auth/session.ts, frontend/src/components/SiteHeader.tsx, frontend/src/App.css and frontend/README.md.
