

Sprint 1 AI Usage Log

Course: SOEN 341 – Software Process

Project: CareerConnect – Job Search and Application Tracking Platform

Sprint: Sprint 1

Responsible Person: Bilal Qadir

Task 1: Understanding Sprint 1 Requirements

Purpose of AI Use:

I used ChatGPT to better understand the Sprint 1 requirements and what our team needed to complete during the sprint.

Chat Link or Prompt/Response:

Prompt: *"Tell me in detail what we have to do in Sprint 1."*

AI-Suggested Content:

ChatGPT summarized the Sprint 1 requirements, including GitHub repository setup, README updates, sprint planning, user stories, task breakdown, team workflow, AI usage logs, meeting minutes, and the requirement to implement at least two basic features.

Validation:

I compared the information provided by ChatGPT with the official SOEN 341 CareerConnect Sprint 1 project document.

Decision:

Accepted.

Reflection:

The AI helped me understand the Sprint 1 instructions more clearly and helped me organize the main tasks required for the project.

Task 2: Updating the CareerConnect README

Purpose of AI Use:

I used ChatGPT to review the existing README file and identify what needed to be updated for the CareerConnect project.

Chat Link or Prompt/Response:

Prompt: I provided the existing README and asked what needed to be fixed because it still contained information from the previous TicketManager project.

AI-Suggested Content:

ChatGPT identified outdated TicketManager and campus event content and suggested replacing it with CareerConnect information. The suggested updates included the project overview, problem description, proposed solution, Sprint 1 plan, proposed features, team workflow, and AI usage information.

Validation:

I compared the suggested changes with the official CareerConnect project requirements and manually reviewed the README before making the changes.

Decision:

Modified before use.

Reflection:

The AI helped identify outdated information in the README and made it easier to update the file so that it matched the current CareerConnect project.

Task 3: Implementing Resume Management Frontend**Purpose of AI Use:**

I used ChatGPT mainly to clarify the feature requirements, understand how the frontend should interact with the backend, and troubleshoot issues during implementation.

Chat Link or Prompt/Response:

Prompt: I asked questions about how the resume upload flow should work, how to connect it to the backend, and how to handle different user states.

AI-Suggested Content:

ChatGPT explained the overall approach for resume upload, file validation, displaying uploaded resumes, and communicating with the backend API.

Validation:

I wrote and integrated the frontend code myself, compared the result with the project requirements, and tested the feature locally.

Decision:

Used as guidance.

Reflection:

The AI was most useful for explaining the implementation approach and helping me troubleshoot issues. I wrote and adjusted the code myself based on the project structure and requirements.

Task 4: Addressing Pull Request Feedback

Purpose of AI Use:

I used ChatGPT to better understand reviewer comments and decide what changes were needed in my resume feature.

AI-Suggested Content:

ChatGPT helped explain the meaning of the review comments, such as using a shared backend URL, improving error handling, changing the route, and keeping uploaded resumes on the same page.

Validation:

I made the code changes myself and checked each change against the reviewer comments before updating the pull request.

Decision:

Used as guidance.

Reflection:

The AI helped me interpret the feedback, but I implemented the requested changes manually.

Task 5: Integrating Authentication with Resume Management

Purpose of AI Use:

I used ChatGPT to understand how the new authentication/session system should be connected to my existing resume feature.

AI-Suggested Content:

ChatGPT explained how the logged-in user's ID could be obtained from the existing session system and used for resume-related requests.

Validation:

I reviewed the authentication files myself, updated my resume implementation, and checked that the frontend compiled correctly. Full testing was blocked by a backend authentication/database issue.

Decision:

Used as guidance.

Reflection:

The AI helped me understand how the authentication system fit into my feature. I made the actual integration changes myself.
